

Policy-as-code with Kubewarden

Divya Mohan

- Senior Technical Evangelist at SUSE
- Documentation maintainer @ Kubernetes
- CNCF Ambassador
- KCNA exam co-creator

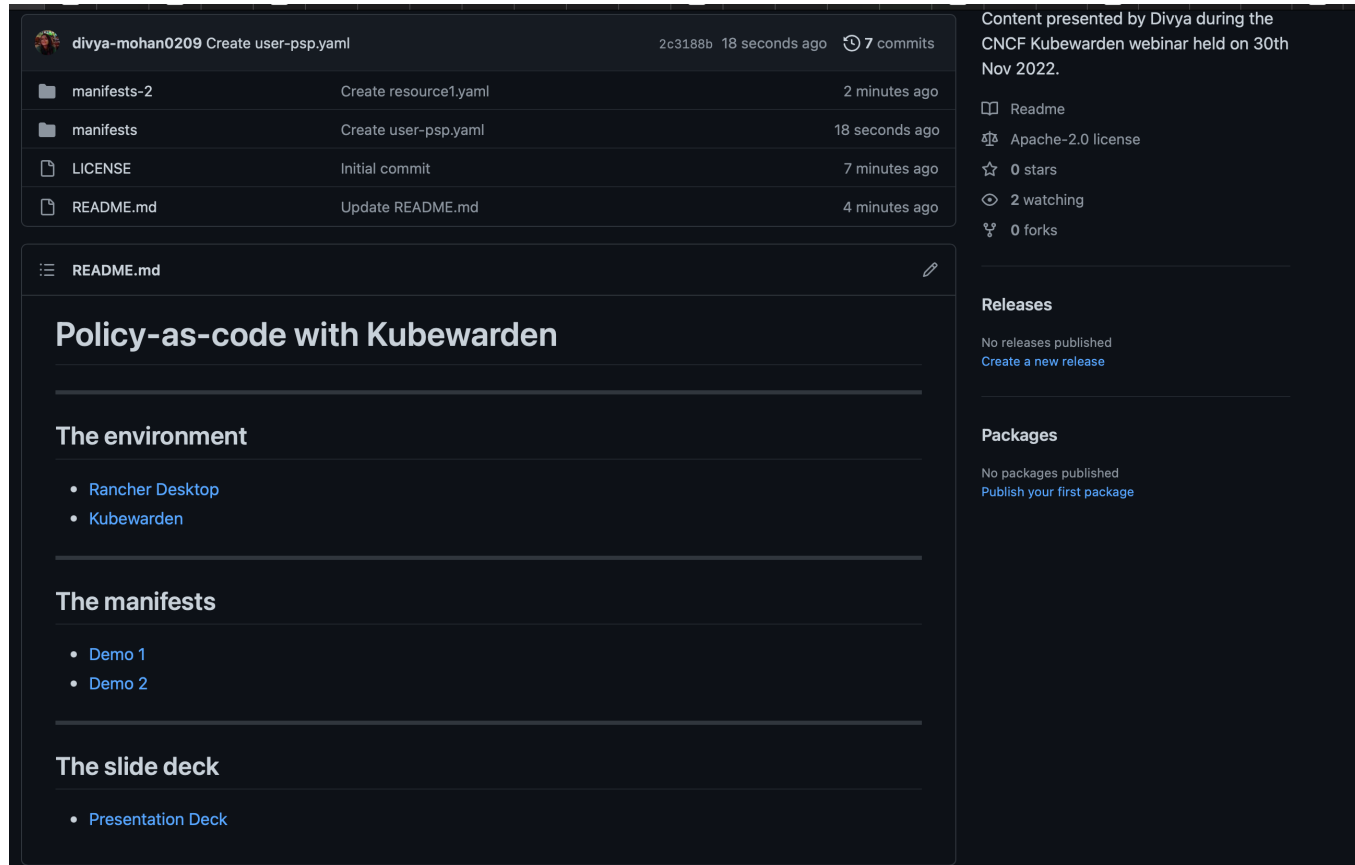

Agenda

1. What is Kubewarden?
2. Architecture
3. PSP, PSA, and Kubewarden
4. Demo # 1
5. What's new in Kubewarden v1.3
6. Demo # 2

Supporting Material

The screenshot shows a GitHub repository interface. At the top, the repository name is 'divya-mohan0209 Create user-psp.yaml' with a commit hash '2c3188b' and a timestamp '18 seconds ago'. Below this is a table of files and their commit history:

File	Commit	Time
manifests-2	Create resource1.yaml	2 minutes ago
manifests	Create user-psp.yaml	18 seconds ago
LICENSE	Initial commit	7 minutes ago
README.md	Update README.md	4 minutes ago

The main content area displays the 'README.md' file. The title is 'Policy-as-code with Kubewarden'. The content is organized into sections:

- The environment**
 - [Rancher Desktop](#)
 - [Kubewarden](#)
- The manifests**
 - [Demo 1](#)
 - [Demo 2](#)
- The slide deck**
 - [Presentation Deck](#)

The right sidebar contains repository statistics and links:

- Content presented by Divya during the CNCF Kubewarden webinar held on 30th Nov 2022.**
- [Readme](#)
- [Apache-2.0 license](#)
- [0 stars](#)
- [2 watching](#)
- [0 forks](#)
- Releases**
 - No releases published
 - [Create a new release](#)
- Packages**
 - No packages published
 - [Publish your first package](#)

What is Kubewarden?

Policy engine for Kubernetes to
simplify policy-as-code

CNCF Sandbox project

What's the secret sauce?

- Users can write Kubernetes policies in their favorite programming language
 - Caveat: The language can compile to Wasm binaries
- Currently supports:
 - Rust
 - Go
 - Swift

What's the secret sauce?

- You can also reuse (almost) all your existing **Rego** policies!
 - Some built-in functions are SDK-dependent i.e. Kubewarden has to implement them
 - Built-ins required by the majority of K8s users are supported.
- Distribution channels:
 - Served by a web server
 - Published & stored inside an OCI compliant registry as OCI artifacts

What's the secret sauce?

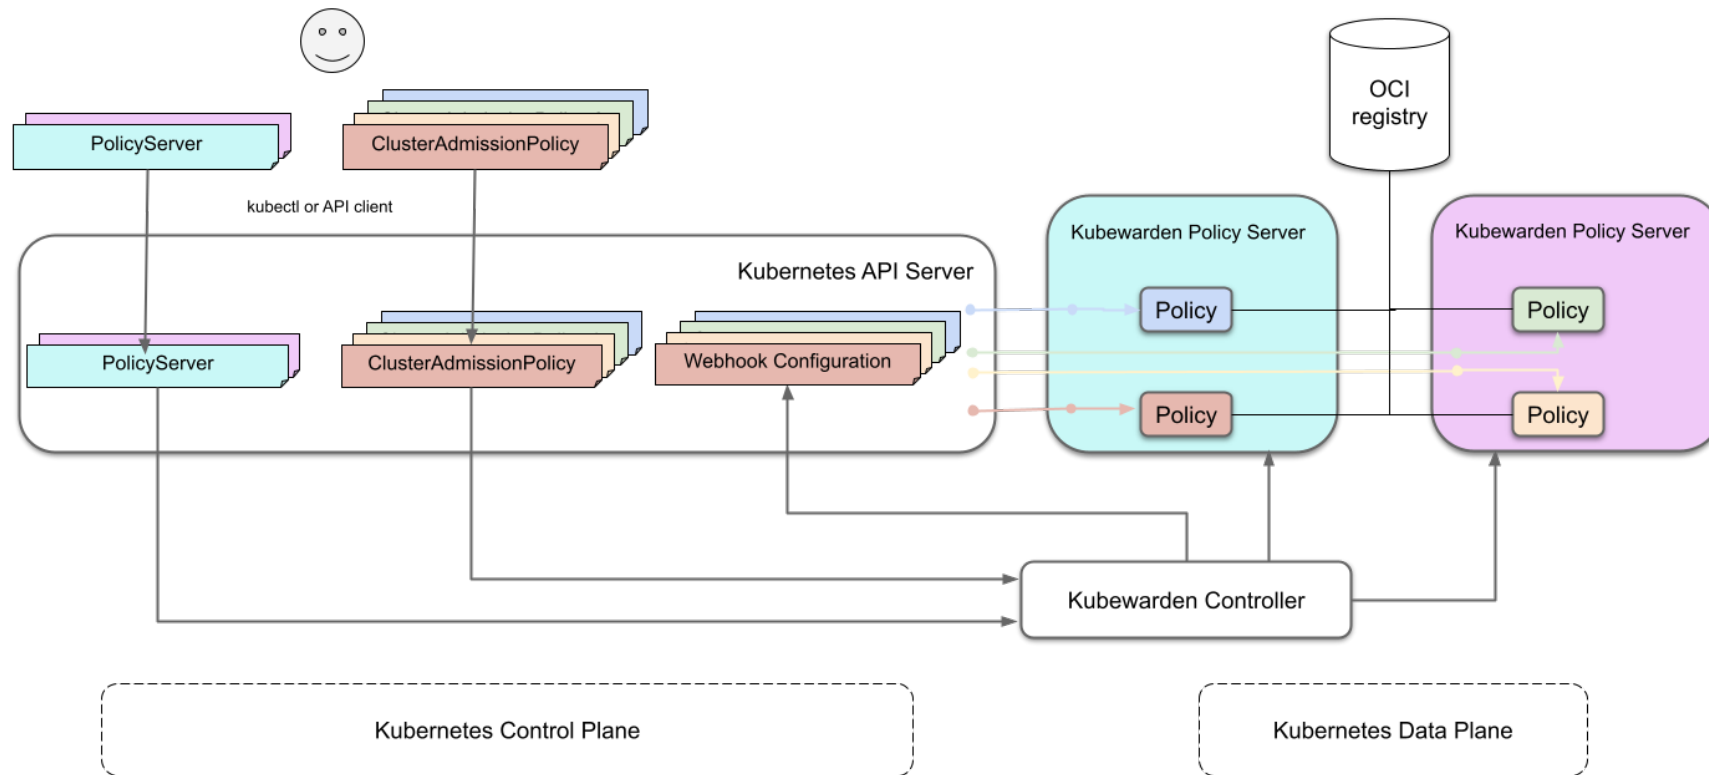

Dynamic admission control

Architecture

Architecture

PSP, PSA, and Kubewarden

PodSecurityPolicy

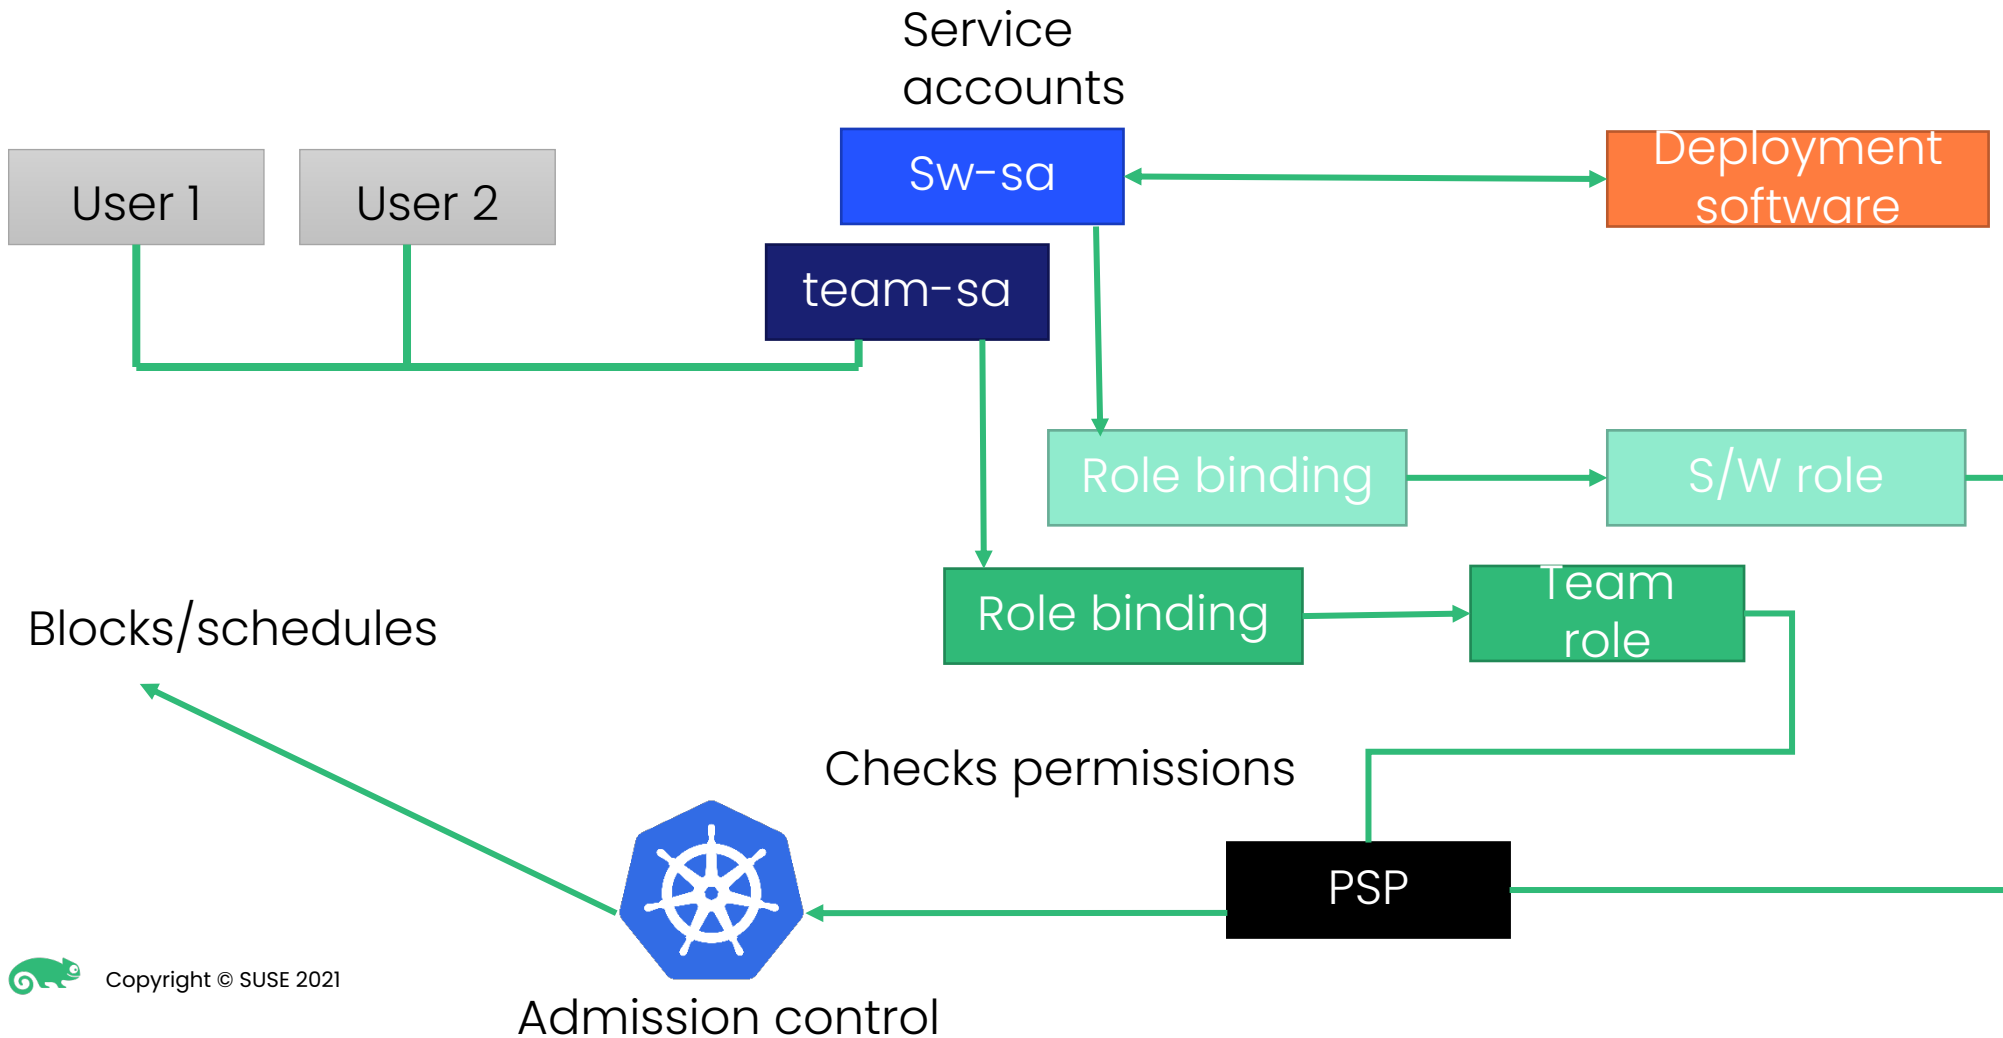

- Framework to ensure that Pods run only with appropriate privileges & can only access appropriate resources
- Kubernetes RBAC links PSPs to users/services through the roles they have
- Enforce the concept of least privilege

kubernetes

PSP in action

What was the problem with PSP?

- Easy to grant broader permissions than intended
- Difficult to determine which PSP applies in a given situation

kubernetes

Pod Security Admission

- Different isolation levels for Pods based on Pod Security Standards
- Applied at the namespace level
- Allows you to define the behavior of pods in a clear & consistent fashion.

kubernetes

What's the problem with Pod Security Admission?

- As of Kubernetes v1.25
 - No mutation capabilities
 - Higher level objects are evaluated ONLY when audit/warn modes are enabled.

kubernetes

👋 Kubewarden!

- Can be used to replace PSP
- Intended to complement Pod Security Admission
- Integrate Kubewarden into a Pod Security Admission profile to mitigate limitations

Demo #1

What's new in Kubewarden v1.3?

What's new in Kubewarden v1.3?

- Joined the CLO Monitor Initiative
 - Currently A-rated with a score of 97%
- Reduced startup time for Policy server
- Ability to handle Sigstore signatures produced using a PKCS11 token

What's new in KubeWarden v1.3?

- New policies that are backward compatible!
 - Environment Variable Scanner Policy
 - Environment Variable Compliance Policy
 - volumeMounts policy
 - deprecated-api-versions policy
- Expansion of scope for some existing policies

Demo #2
